1 INTRODUCTION

This document is the *Galileo Initial Search and Rescue Service (SAR/GALILEO IS) Public Performance Report* for the period of January, February and March 2018. Following the declaration of Initial Services in December 2016, a new edition will be published after each quarter, in order to provide the public with actual performance statistics of the Galileo SAR Service.

This document reports on the following performance parameters, with respect to their Minimum Performance Levels (MPLs) declared in the [SAR-SDD]:

- ◇ Detection Performance;
- ◇ Location Performance;
- ◇ Infrastructure availability performance;

The document comprises the following sections:

Section 1: Introduces the Galileo constellation status for the Search and Rescue Service over the quarterly reporting period. Information about the planned evolution of the constellation is given in Section 2.

Section 2: Provides an executive summary of the achieved performance. Details are reported in the following chapters.

Section 3: Provides the detailed performance for the SAR/Galileo Initial Service Detection and Location Performance and is organised in three subsections: "Detection Probability", "Location Probability" and "Location Accuracy".

Section 4: Provides the detailed performance for the SAR/Galileo Initial Service Infrastructure availability and is presented in three subsections: "Availability of the SAR/Galileo Ground Segment", "Availability of SAR/Galileo Space Segment" and "Availability of the SAR/Galileo Server".

Section 5: The cited reference documents are listed.

1.1 GALILEO CONSTELLATION STATUS FOR SAR/GALILEO

Table 1a provides the status of the Galileo constellation relevant for the SAR/Galileo Initial Service, for which the performance data has been derived for the reporting period. It should be noted that the Galileo satellites GSAT-0101 and GSAT-0102 do not include a Search and Rescue payload and are therefore not include in the constellation status.

| Satellite Code | SV ID (PRN) | Cospas-Sarsat ID | Orbital Slot | Status |
|----------------|-------------|------------------|--------------|----------------------------|
| GSAT-0103 | 19 | 419 | C04 | Available |
| GSAT-0104 | 20 | 420 | C05 | Available ¹ |
| GSAT-0201 | 18 | 418 | Ecc* | Available |
| GSAT-0202 | 14 | 414 | Ecc* | Available |
| GSAT-0203 | 26 | 426 | B08 | Available |
| GSAT-0204 | 22 | 422 | B03 | Not Available ² |
| GSAT-0205 | 24 | 424 | A08 | Available |
| GSAT-0206 | 30 | 430 | A05 | Available |
| GSAT-0207 | 07 | 407 | C01 | Available |
| GSAT-0208 | 08 | 408 | C07 | Available |
| GSAT-0209 | 09 | 409 | C02 | Available |
| GSAT-0210 | 01 | 401 | A02 | Available |
| GSAT-0211 | 02 | 402 | A06 | Available |
| GSAT-0212 | 03 | 403 | C03 | Available |
| GSAT-0213 | 04 | 404 | C06 | Available |
| GSAT-0214 | 05 | 405 | C08 | Available |

Table 1a: Galileo Reported Constellation Information for the SAR/Galileo Service

* Although Galileo satellites GSAT-0201 and GSA-0202 are located in an eccentric orbit, they have been declared operational for the SAR/Galileo Initial Service.

Four (4) new Galileo satellites were successfully launched on 12/12/2017 (see NAGU [2017047](#)):

¹ Galileo satellite GSAT-0104 all navigation signals are unavailable, however SART is active and used in operations.

² GSAT-0204 (E22) was removed from active service on 08/12/2017 for the purpose of constellation management (ref. NAGU: 2017045). Therefore its performance is not reported in the Dashboard (ref.: Table 3).

| Satellite Code | SV ID (PRN) | CCSDS ID [hex] | Orbital Slot | Status |
|----------------|-------------|----------------|--------------|---------------------|
| GSAT-0215 | 21 | 2C5 | A03 | Under commissioning |
| GSAT-0216 | 25 | 2C6 | A07 | Under commissioning |
| GSAT-0217 | 27 | 2C7 | A01 | Under commissioning |
| GSAT-0218 | 31 | 2C8 | A04 | Under commissioning |

Table 1b: Additional Galileo Satellites under Commissioning

Note that performance for these satellites will be reported once their availability for SAR/Galileo Service is declared.

For the most up to date information, please refer to the European GNSS Service Centre (GSC) Web pages:

| Constellation Information | https://www.gsc-europa.eu/system-status/Constellation-Information |
| Reference Constellation Orbital and Technical Parameters | https://www.gsc-europa.eu/system-status/orbital-and-technical-parameters |
| Incident Reporting | https://www.gsc-europa.eu/helpdesk/galileo-incident-report-form (Galileo Incidents Report Form) |
| Interactive support to users | https://www.gsc-europa.eu/contact-us/helpdesk (Galileo Help Desk) |

Table 2: GSC Main Information web pages about Galileo Status

Note that the Galileo Help Desk allows close interaction with users, both to support the exploitation of Galileo services and to collect relevant information on signal performance as observed by the users.

Finally, an important service provided by the GSC consists of the provision of detailed orbit data for the Galileo satellites on a server accessible by the SAR community and for which access can be requested via the Galileo Help Desk.

2 EXECUTIVE SUMMARY

During the quarterly reporting period, the measured SAR/Galileo Initial Service performance figures generally exceed the Minimum Performance Level (MPL) targets specified in the [SAR-SDD] with significant margins, with the exception of Larnaca Availability for January and February 2018. The following dashboard summarise the compliance with the MPLs, using the colour coding defined in the legend below Table 3.

| SAR/GALILEO INITIAL SERVICE MPLs | | Target Value | Jan-18 | Feb-18 | Mar-18 | |
|----------------------------------|--------------------------------------|----------------------------------------------------------|---------|--------|--------|--|
| Detection and Location Service | Probability | Valid Message Detection Probability after 1 burst | ≥ 99% | | | |
| | | Location Probability after 1 transmitted burst | ≥ 75% | | | |
| | | Location Probability after 12 transmitted bursts | ≥ 98% | | | |
| | Accuracy | Location accuracy after 1 transmitted burst within 5 km | ≥ 70% | | | |
| | | Location accuracy after 12 transmitted bursts within 5km | ≥ 95% | | | |
| | | Location accuracy after 12 transmitted bursts within 2km | ≥ 80% | | | |
| Infrastructure Availability | Maspalomas/ EU MEOLUT Availability | Nominal | ≥ 95% | | | |
| | | Nominal + Degraded | ≥ 97.5% | | | |
| | Spitzbergen/EU MEOLUT Availability | Nominal | ≥ 95% | | | |
| | | Nominal + Degraded | ≥ 97.5% | | | |
| | Larnaca/EU MEOLUT Availability | Nominal | ≥ 95% | | | |
| | | Nominal + Degraded | ≥ 97.5% | | | |
| Satellites | Average SAR Transponder Availability | ≥ 90% | | | | |

Table 3: MPL Fulfilment Status Dashboard ³

³ An integration window of 130 [s] is considered instead of 90 [s] described in the [SAR-SDD] §5.1.2 for the computation of the location probability after 1 transmitted burst.

| | | | |
|-----------|-----------|-----------|-----------|
| GSAT-0103 | GSAT-0104 | GSAT-0201 | GSAT-0202 |
| GSAT-0203 | GSAT-0204 | GSAT-0205 | GSAT-0206 |
| GSAT-0207 | GSAT-0208 | GSAT-0209 | GSAT-0210 |
| GSAT-0211 | GSAT-0212 | GSAT-0213 | GSAT-0214 |

Allocation of Satellites in the dashboard above

Legend

| | |
|-----------------------------------------------------------------------------------|----------------------------------------------------------------------------------|
|  | MPL measurement not available |
|  | MPL measurement not provided. Satellite available (constellation spare) |
|  | Target Value for MPL is fulfilled |
|  | Target Value for MPL is NOT fulfilled (less than 10% away from the Target Value) |
|  | Target Value for MPL is NOT fulfilled (more than 10% away from the Target Value) |

The Detection and Location Performance KPIs are computed based on 5 reference beacons (REFBE) located in the SAR/Galileo Coverage area (SGC) defined in the [SAR-SDD].

Performance of the Detection and Location Service is provided for the Worst Reference Beacon Location for each of the individual performance parameters.

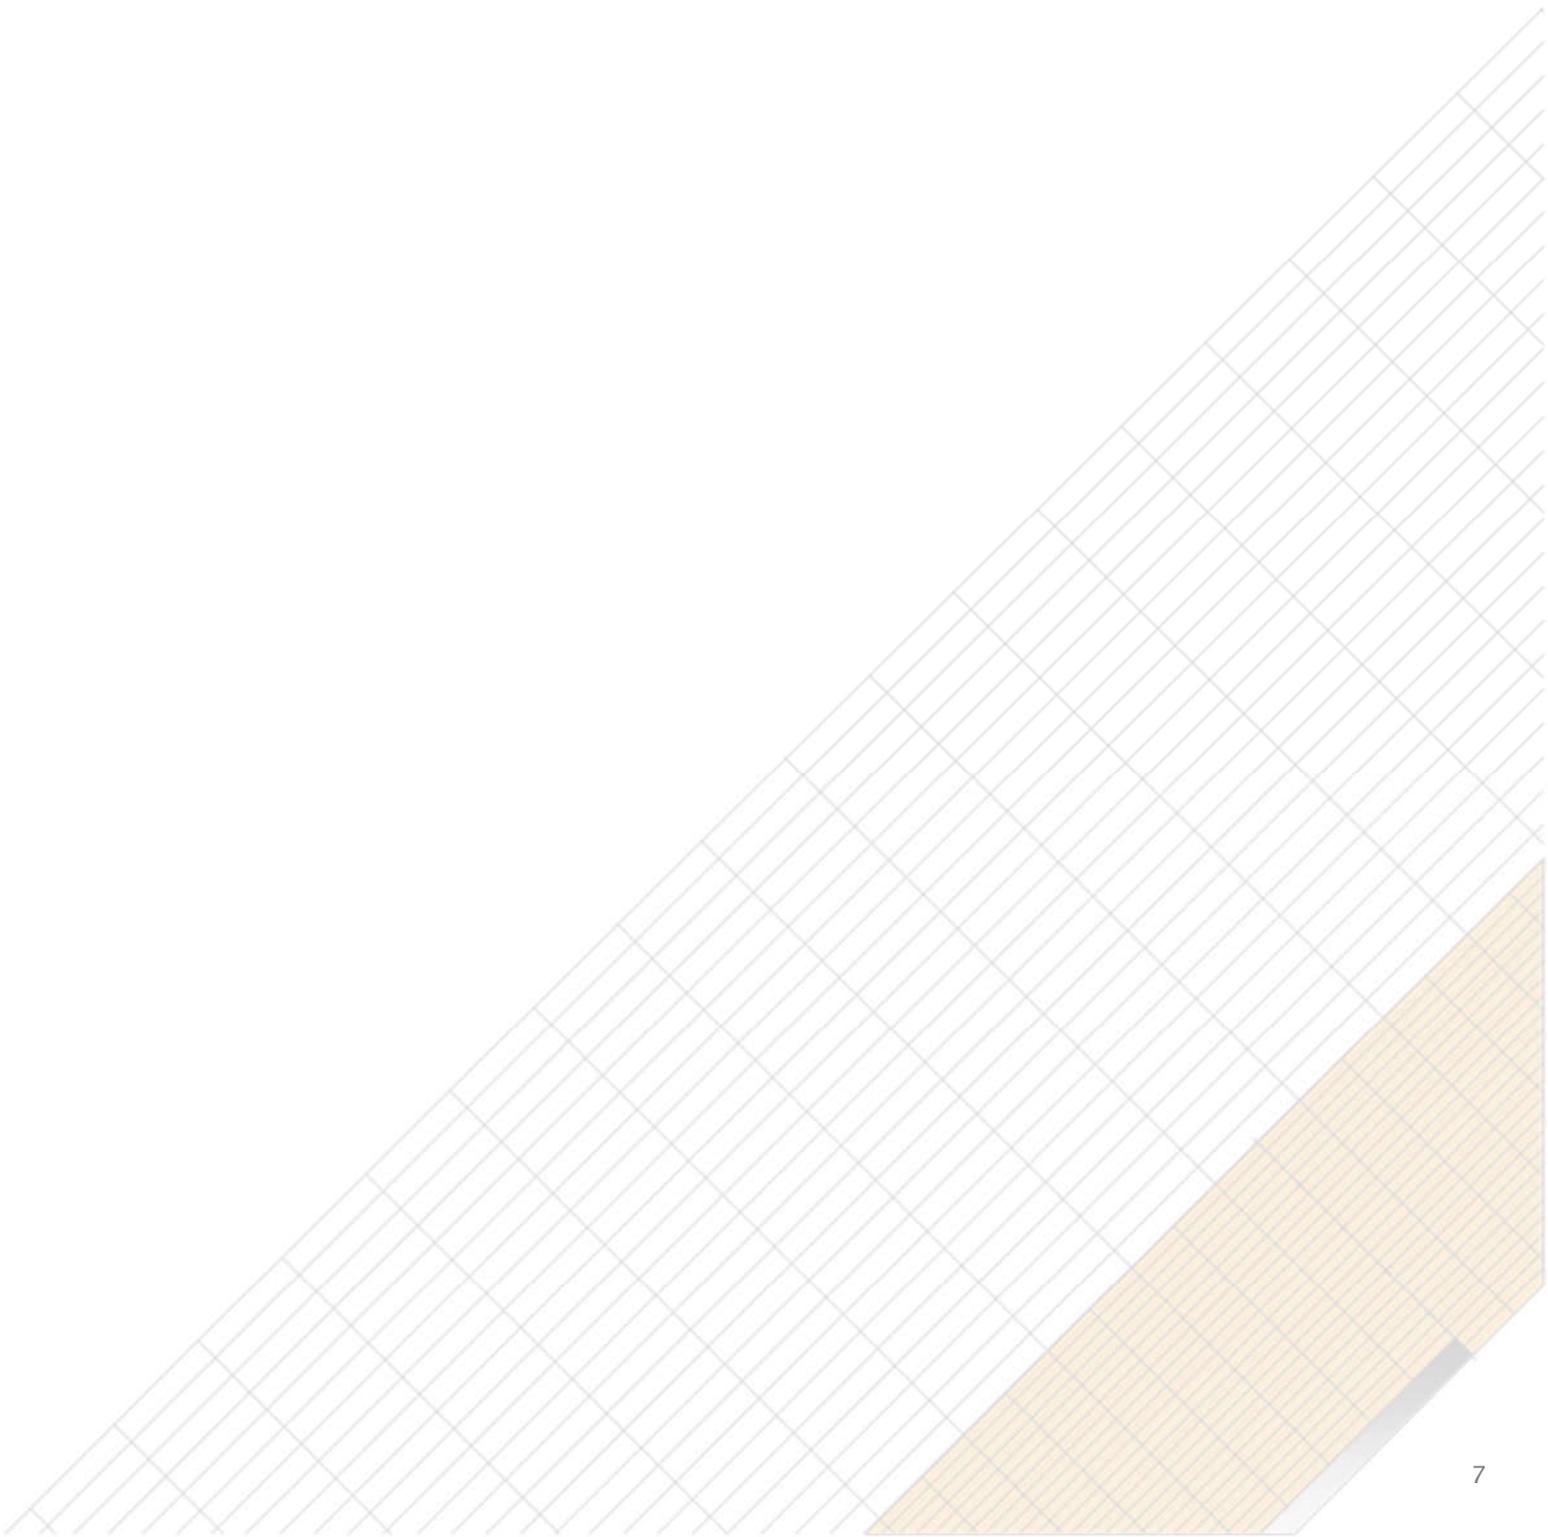

Performance of the Detection Service is above expectations, with monthly values of the detection probability of a single burst of **100%**, where the MPL target is 99%.

Performance of Location Probability is above expectations, with monthly average values higher than **98.8%** for single burst location probability, where the MPL target is 75%, and **100%** for the multi-burst location probability, where the MPL target is 98%.

The **Performance of Location Accuracy** is also above expectations, with average monthly values higher than **97.3%** and **98.5%** for the probability to locate with an accuracy of **5** [km] respectively in single burst and multi-burst mode, while the MPLs are 70% and 95% respectively. **The Probability of location** to within **2** [km] accuracy in multi-burst mode is higher than **90.3%**, while the MPL is 80% and showing a positive trend.

The **Availability Performance of the SAR/Galileo Ground Segment** provided in Table 3, is reported as defined in the [SAR-SDD] where the target values for MEOLUT availability are averaged over a period of 12 continuous months. The yearly availability performances of Maspalomas and Spitzbergen MEOLUTS reach the MPL target values of 95% in "Nominal" mode and 97.5% in "Nominal + Degraded" mode, with average values higher than **96.8%** and **98.1%** for Maspalomas, and **98.6%** and **99.3%** for Spitzbergen. The Larnaca MEOLUT yearly availability has been strongly affected by the underperformance experienced during the months of February and March 2017, nevertheless since March 2018, the trend has been corrected and the MPL target value is reached with **97.1%** (over 12 months) in "Nominal" mode and **99.2%** in "Nominal + Degraded" (over 12 months).

The **Availability of the Search and Rescue Repeaters** is still significantly above expectations during the period January – March 2018, as the SAR repeaters measured availability was **100%** while the MPL is 90%.

3 SAR/GALILEO INITIAL SERVICE DETECTION AND LOCATION PERFORMANCE

In this section of the report the following detailed performance figures for the SAR/Galileo Initial Service are provided:

- ◇ Detection Probability in section 3.1
- ◇ Location Probability in section 3.2
- ◇ Location Accuracy in section 3.3

3.1 DETECTION PROBABILITY

The detection probability performance is computed for each Reference Beacon as the valid message detection probability after 1 transmitted burst. The detailed computation process for this performance parameter is described in the [SAR-SDD].

Figure 1 below shows the monthly single burst detection probability for each of the SAR/Galileo Reference Beacons (REFBE).

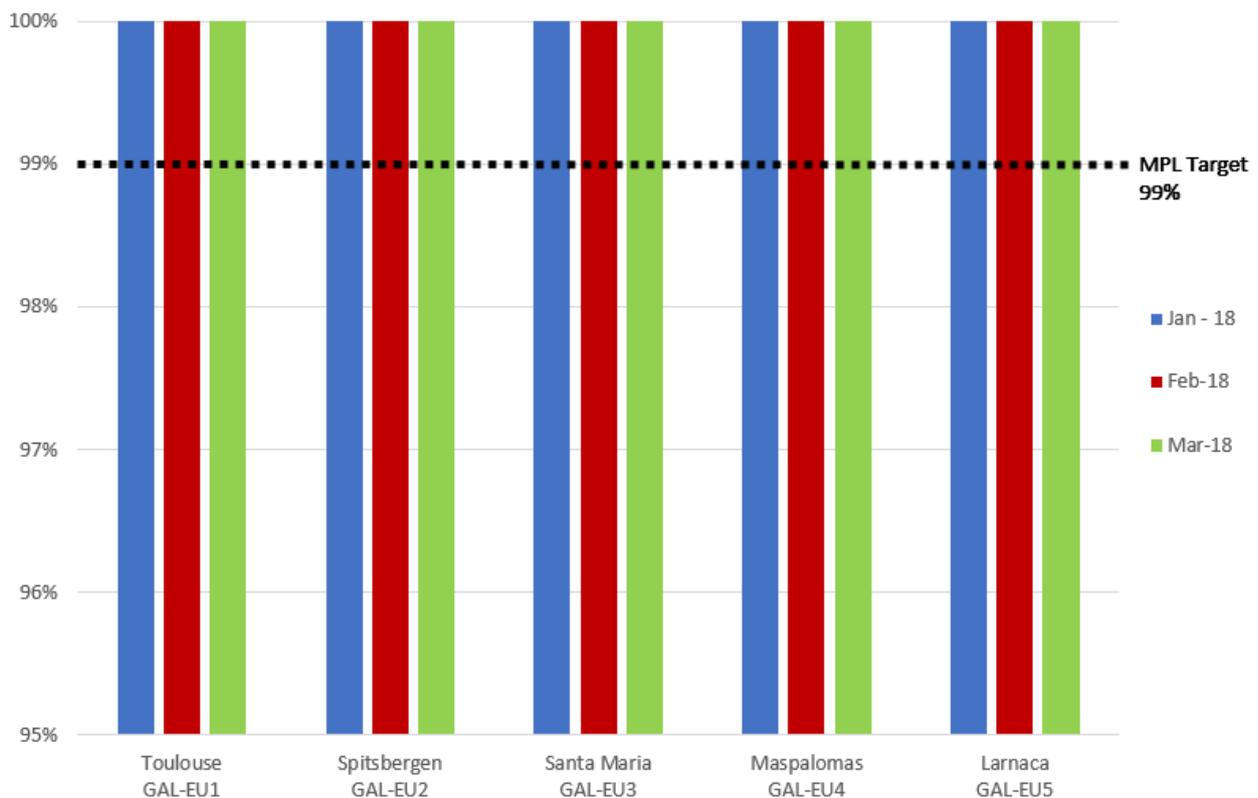

Figure 1: Per Reference Beacon Single Burst Detection Probability

The detection probability for each of the Reference Beacons is always above the Minimum Performance Level of 99% ⁴.

3.2 LOCATION PROBABILITY

The location probability performance is computed for each Reference Beacon after 1 transmitted burst (single burst) and after 12 transmitted bursts (multi-bursts). The detailed computation process for this performance parameter is described in the [SAR-SDD]. The Minimum Performance Levels defined in the [SAR-SDD] are valid when the SAR/Galileo MEOLUTs are in nominal mode.

Figure 2 below shows the monthly single burst location probability for each of the SAR/Galileo Reference Beacons (REFBE). The single burst location probability for each of the Reference Beacons is always above the Minimum Performance Level from [SAR-SDD], specified as 75% ⁵.

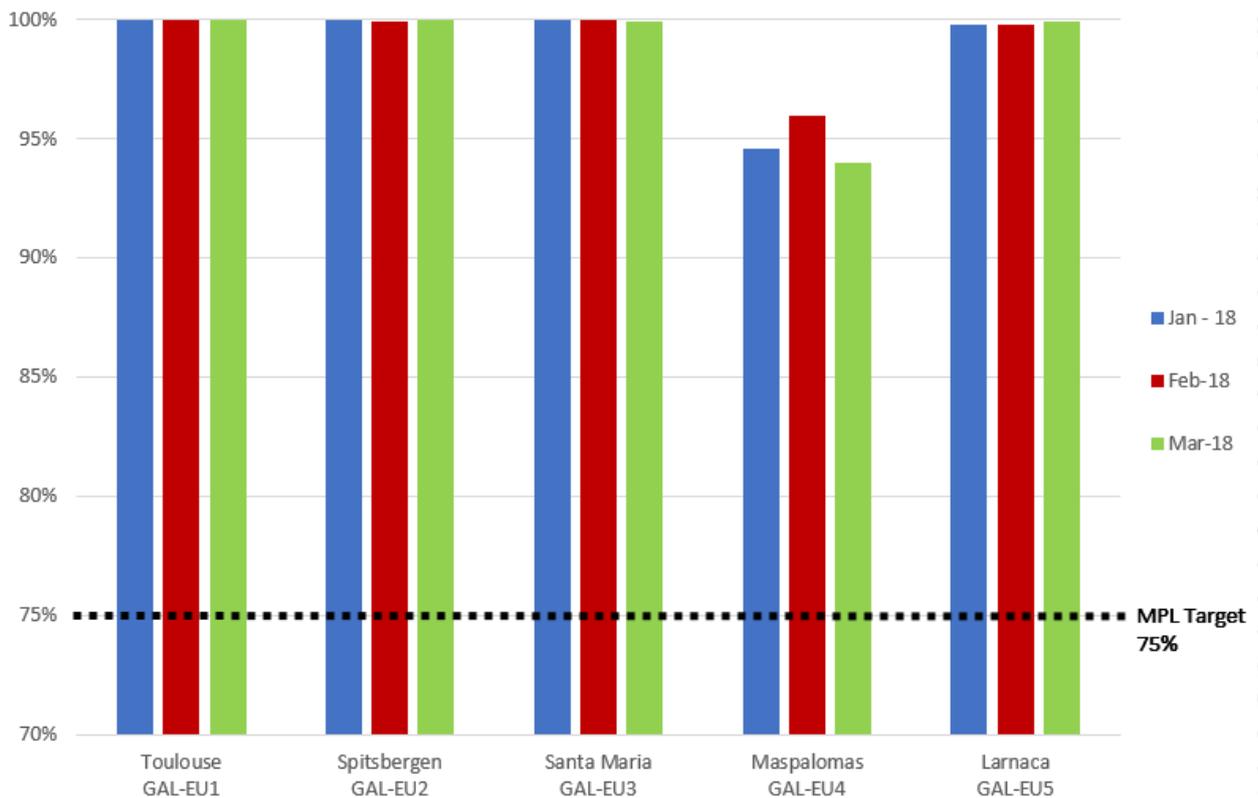

Figure 2: Per Reference Beacon Single Burst Location Probability

Figure 3 below shows the monthly multi-burst (12 bursts – 10 minutes) location probability for each of the SAR/Galileo Reference Beacons. The multi-burst location probability for each of the

⁴ Ref.: [SAR-SDD] , §5.1.1 (Table 9)

⁵ Ref.: [SAR-SDD] , §5.1.1 (Table 10)

Reference Beacons is in all cases 100%, well above the Minimum Performance Level from [SAR-SDD], specified as 98% ⁶.

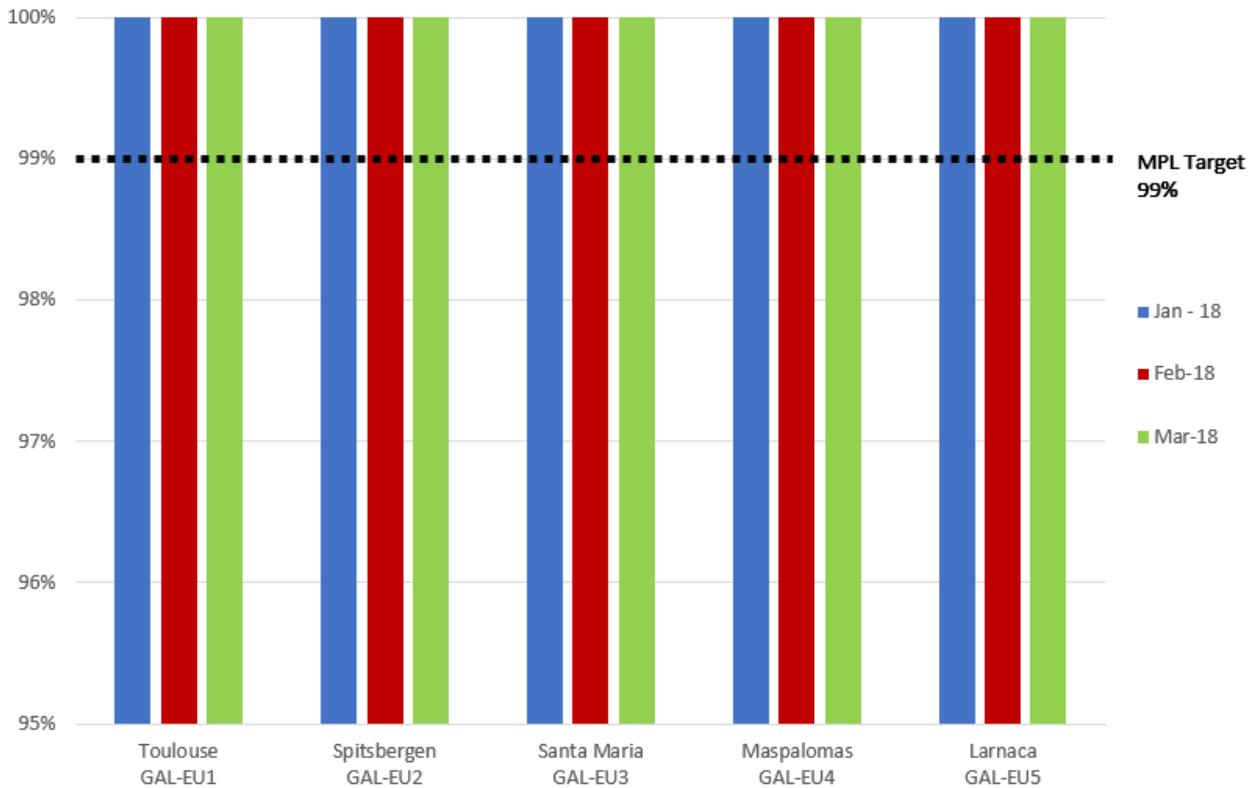

Figure 3: Per Reference Beacon Multi-Burst Location Probability (10 min).

3.3 LOCATION ACCURACY

The Location accuracy performance is defined in the [SAR-SDD] as the probability that a location is computed with an error bounded by a given threshold. These probabilities are computed for each Reference Beacon after 1 transmitted burst (single-burst) and after 12 transmitted bursts (multi-bursts) for the 5 km threshold and in multi-bursts only for the 2km threshold. The detailed computation process for this performance parameter is described in the [SAR-SDD]. The Minimum Performance Levels defined in the [SAR-SDD] are valid when the MEOLUT is in nominal mode.

Figure 4 below shows the monthly probability of achieving a location with 5 km accuracy with a single burst from each of the SAR/Galileo Reference Beacons. The probability of achieving 5km accuracy in single burst location for each of the Reference Beacons is always above the Minimum Performance Level from [SAR-SDD], specified as 70% ^{5 7}.

⁶ Ref.: [SAR-SDD] , §5.1.1 (Table 10)

⁷ Ref.: [SAR-SDD] , §5.1.1 (Table 10)

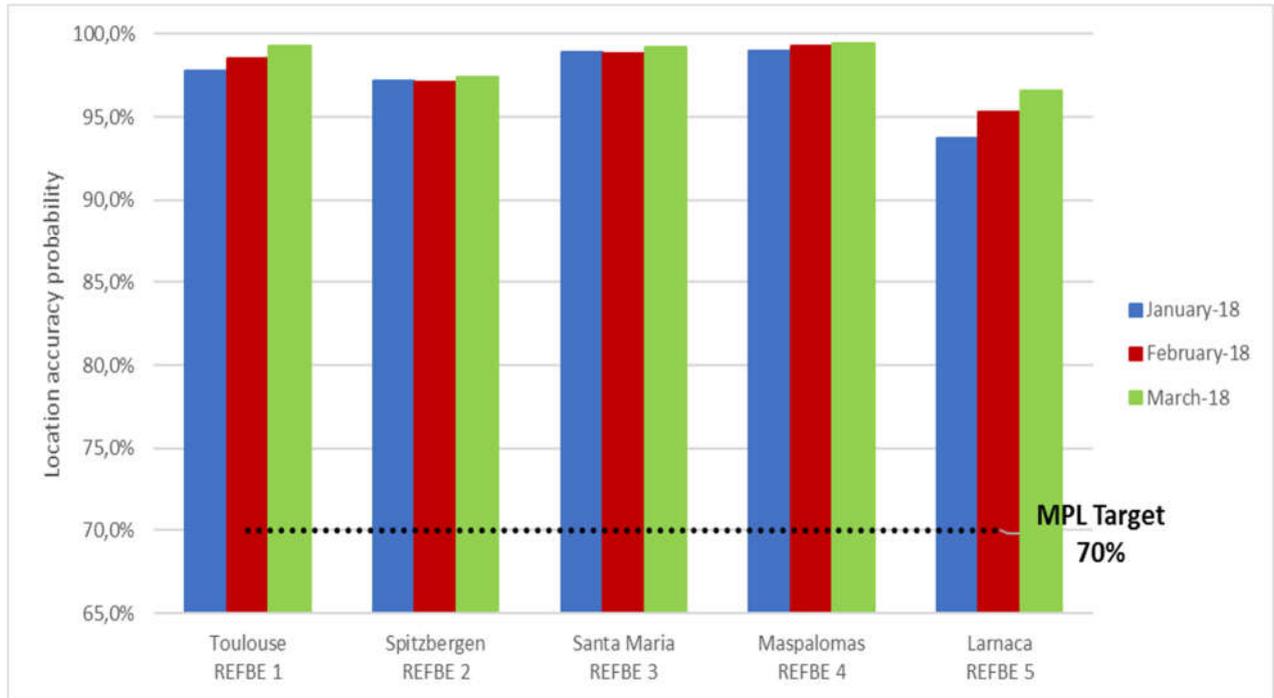

Figure 4: Per Reference Beacon Probability of 5km Accuracy in Single Burst

Figure 5 below shows the monthly probability of achieving a location with 5 km accuracy in multi-burst mode (12 bursts – 10 minutes) for each of the SAR/Galileo Reference Beacons. The probability of achieving 5km accuracy in multi-burst location for each of the Reference Beacons is always above the Minimum Performance Level from [SAR-SDD], specified as 95% ⁸.

The observed decrease of the location performance in Larnaca Reference Beacon is linked to a power outage after a lightning stroke in Larnaca MEOLUT Local Facility during the course of January. The knock on effects are also visible in the probability of 2km accuracy reported in

Figure 6.

⁸ Ref.: [SAR-SDD] , §5.1.1 (Table 10)

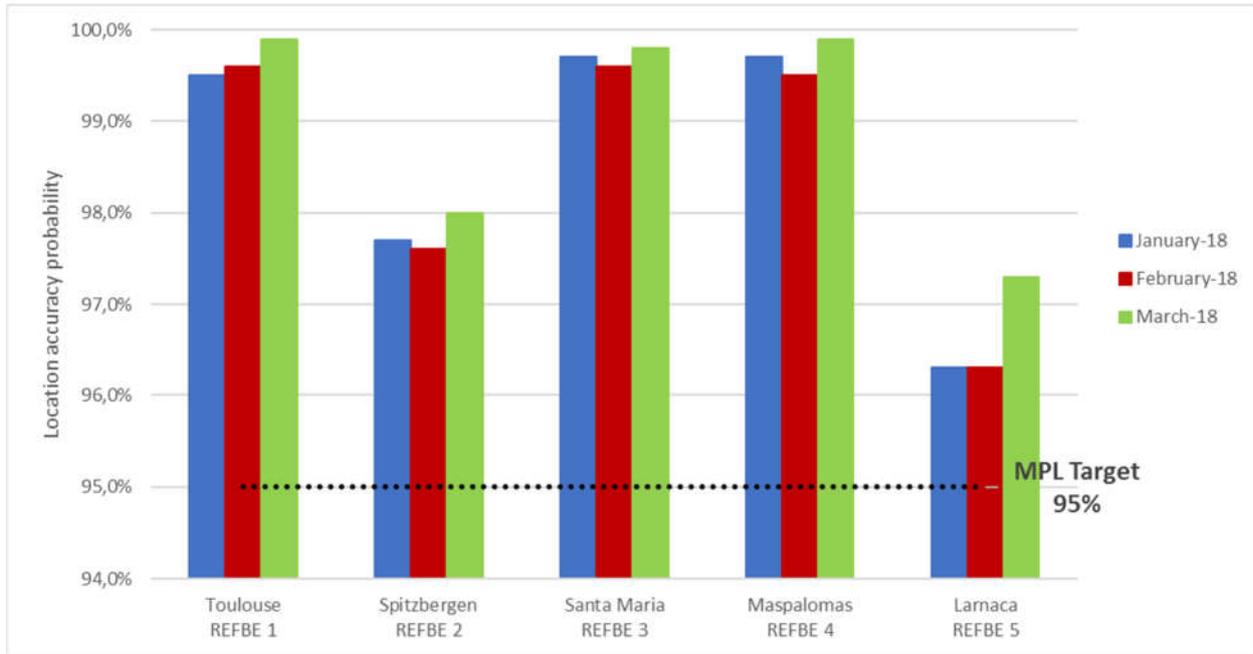

Figure 5: Per Reference Beacon Probability of 5km Accuracy in Multi-Burst

Figure 6 below shows the monthly probability of achieving a location with 2 km accuracy in multi-burst mode (12 bursts – 10 minutes) for each of the SAR/Galileo Reference Beacons. The probability of achieving 2km accuracy in multi-burst location for each of the Reference Beacons is always above the Minimum Performance Level from [SAR-SDD], specified as 80%⁹.

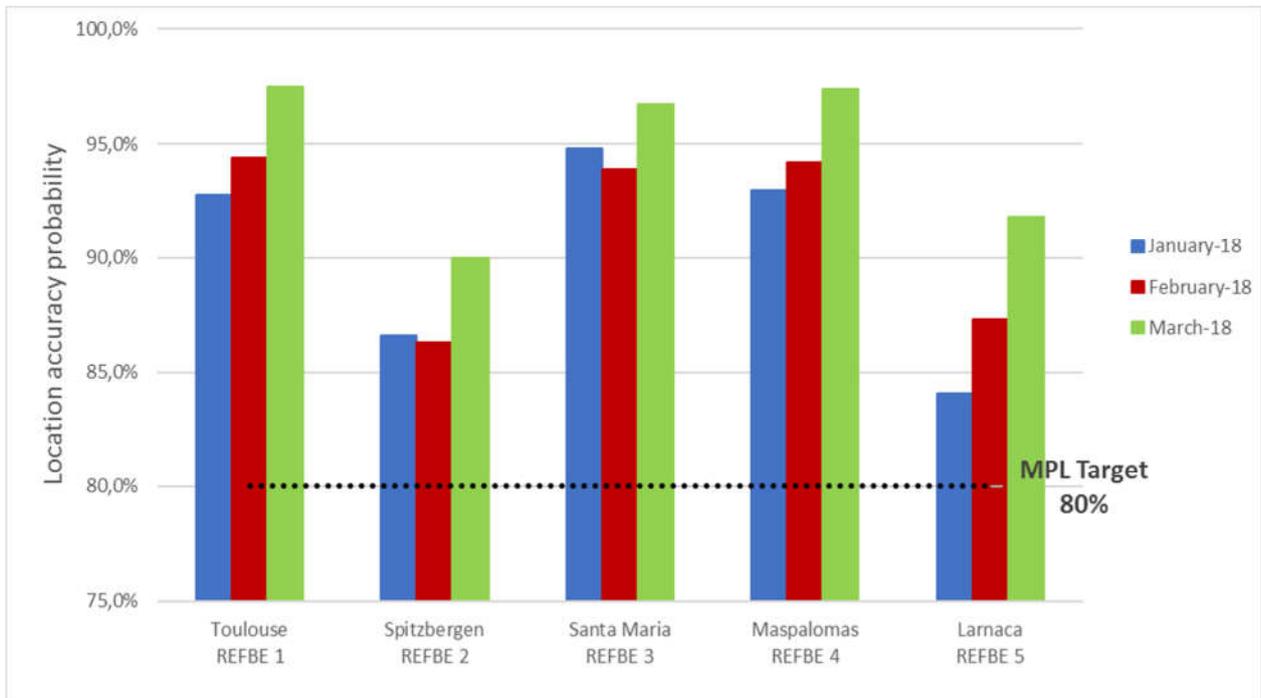

Figure 6: Per Reference Beacon Probability of 2km Accuracy in Multi-Burst

⁹ Ref.: [SAR-SDD] , §5.1.1 (Table 10)

4 SAR/GALILEO INFRASTRUCTURE AVAILABILITY PERFORMANCE

In this section of the report the following performance figures are provided:

- ◇ Availability of the SAR/Galileo Ground Segment in section 4.1
- ◇ Availability of the SAR/Galileo Space Segment in section 4.2
- ◇ Availability of the SAR/Galileo Server in section 4.3

4.1 AVAILABILITY OF THE SAR/GALILEO GROUND SEGMENT

The Minimum Performance Levels for the availability of the SAR/Galileo Ground Segment Infrastructure are defined in the [SAR-SDD]¹⁰.

The MEOLUT Local Facility availability Minimum Performance Level is defined over a period of twelve months, with a sliding window moving one month ahead every month. Starting from December 2017, key performance indicators are reported over a twelve months period. However, in the Figure 7 and Figure 8 below, the performance levels are also reported for each month in order to assess the performance trend over time.

As indicated in Section 2, Larnaca MEOLUT Local Facility, which suffered significant degradation during the 1st quarter of 2017, has gradually recovered its nominal status and since March 2018, the cumulative availability performance fulfils the MPL target (95%) as achieves 97.1% averaged over the last twelve months of service delivery.

All MEOLUT Local Facilities show monthly “Nominal” mode availability performance better than the MPL target over the reporting period, despite the software upgrade undertaken by all MEOLUT Local Facilities during the month of March 2018 that slightly degraded Larnaca (95.1%), Maspalomas (96.2%) and Spitsbergen (96.4%) monthly availability performance as illustrated in Figure 7 below.

On the other hand, the “Nominal” cumulative average availabilities of all MEOLUT Local Facilities over the last twelve months of service delivery are better than the MPL.

¹⁰ Ref.: [SAR-SDD] , §5.2.2 (Table 13, Table 14 and Table 15)

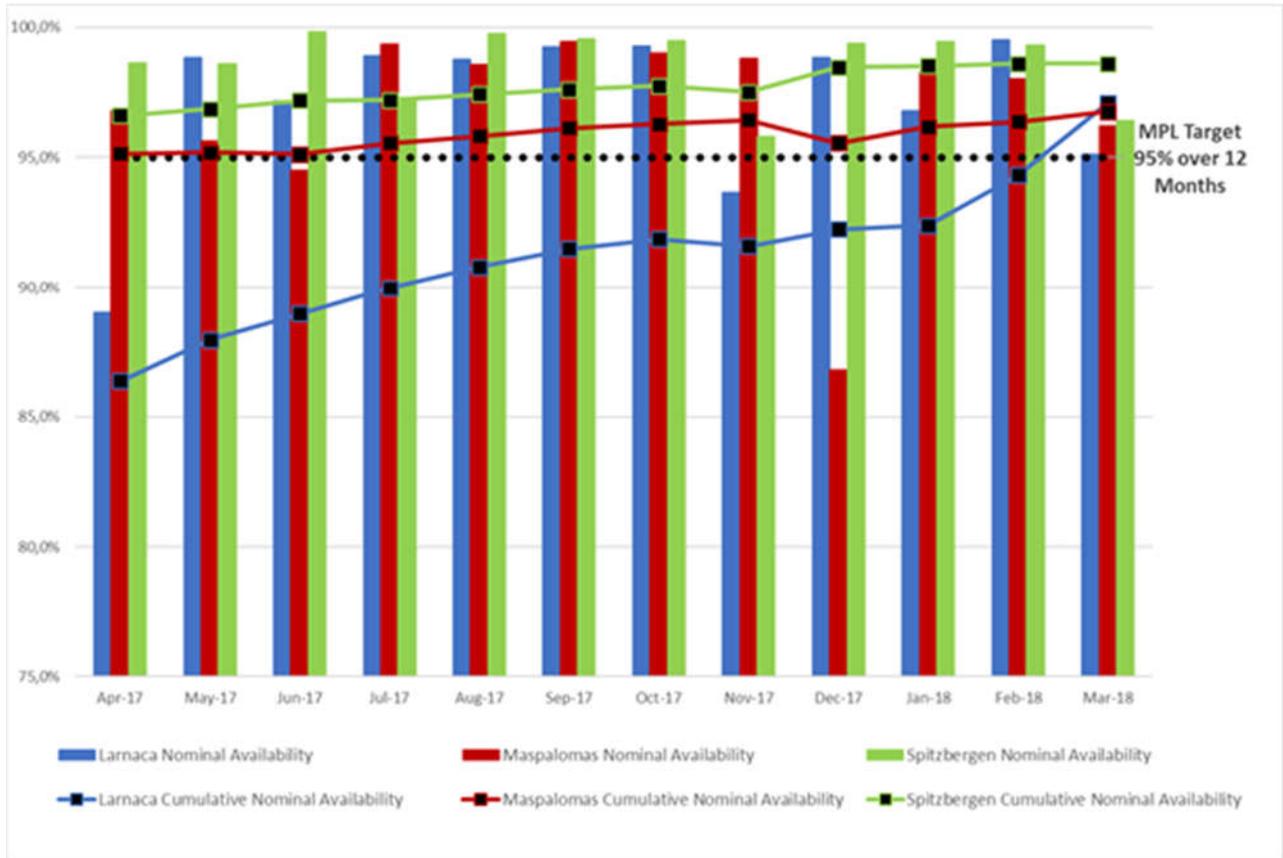

Figure 7: Per MEOLUT Monthly Availability of Nominal Mode

Figure 8 below presents the availability of each of the MEOLUT Local Facilities in "Nominal + Degraded" mode during the last twelve months of Service. The Larnaca, Maspalomas and Spitzbergen MEOLUT Local Facilities show January and February availability in "Nominal + Degraded" Mode above the Minimum Performance Level, which is specified as 97.5%. As explained above, the new software installed during the month of March caused a limited monthly availability degradation and Larnaca (97.3%), Maspalomas (97.1%) and Spitzbergen (97.0%) MEOLUT Local Facilities do not reach the MPL target.

On the other hand, the cumulative average availabilities over the twelve months period of service delivery exceed the Minimum Performance Level for all the MEOLUT Local Facilities with Larnaca (99.2%), Maspalomas (98.1%) and Spitzbergen (99.3%). As indicated in Section 2, the Larnaca cumulative average availability over the last twelve months in "Nominal + Degraded" mode has gradually increased and is above the MPL target value since March 2018.

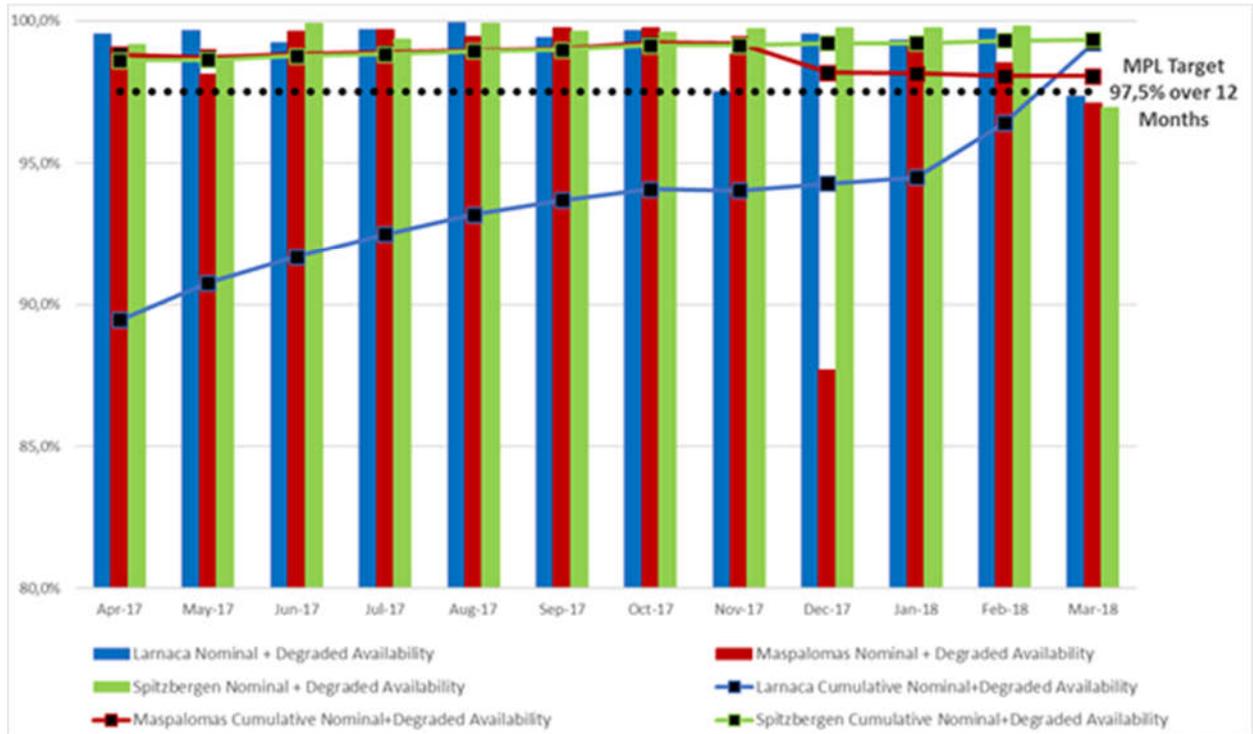

Figure 8: Per MEOLUT Monthly Availability of "Nominal + Degraded" Mode

The MEOLUT Tracking Coordination Facility (MTCF) and SAR Network (SARN) cumulative availability over the last twelve month of Service are reported in Table 4 below.

| Other SAR/Galileo Ground Segment Elements | Target Value (over 12 months) | January-18 | February-18 | March-18 |
|-------------------------------------------|-------------------------------|------------|-------------|----------|
| MTCF Availability | ≥ 99.95% | 97.30% | 97.40% | 97.50% |
| SARN Availability | ≥ 99.40% | 99.40% | 99.94% | 99.90% |

Table 4: MTCF and SARN Cumulative Availability, January – March 2018

The MTCF cumulative availability does not achieve the required MPL target value, which is specified as 99.95% over a period of one year. The MTCF is considered not operationally available when one or both of the functions needed for the TOA/FOA exchange process and the Tracking Plan computation are not available. It should be noted that even if the MTCF is not in operational mode, this does not necessarily systematically affect operational availability and performance of the SAR/Galileo Service.

Table 5 below presents, for information, the MTCF and SARN monthly availability values over the reporting period.

| Other SAR/Galileo Ground Segment Elements | Target Value (over 12 months) | January-18 | February-18 | March-18 |
|-------------------------------------------|-------------------------------|------------|-------------|----------|
| MTCF Availability | ≥ 99.95% | 99.90% | 99.40% | 100% |
| SARN Availability | ≥ 99.40% | 99.96% | 99.94% | 99.70% |

Table 5: MTCF and SARN Monthly Availability, January – March 2018

4.2 AVAILABILITY OF THE SAR/GALILEO SPACE SEGMENT

During the period of January to March 2018, all SAR Transponders achieved an availability of **100%** each month.

4.3 AVAILABILITY OF THE SAR/GALILEO SERVER

During the period of January – March 2018, the SAR/Galileo Server located in the GSA headquarters has provided orbit data for the SAR satellites. There is currently no commitment from the Galileo Programme on the Minimum Performance Level for the availability of this SAR/Galileo server. However, this server service has been provided with a high average availability during the period March 2017 – March 2018 of 98.7%. The monthly availabilities over the reporting period for this server are shown in the Table 6 below for information.

| | Target Value | January-18 | February-18 | March-18 |
|--------------------------------------------|--------------|------------|-------------|----------|
| SAR/Galileo Orbit Data Server Availability | N/A | 97.58% | 99.05% | 99.90% |

Table 6: SAR/Galileo Orbit Data Server Monthly Availability, January–March 2018
